

Some people are blessed with a good balance

# Vertigo is very common

About 25% of the population has some vertigo every year and about 5% have vertigo with an intensity of clinical significance

It is a frequent cause for consultation in general and specialised medicine and emergency

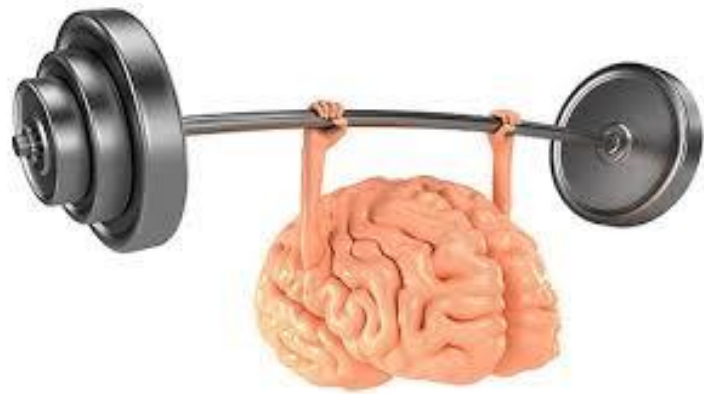

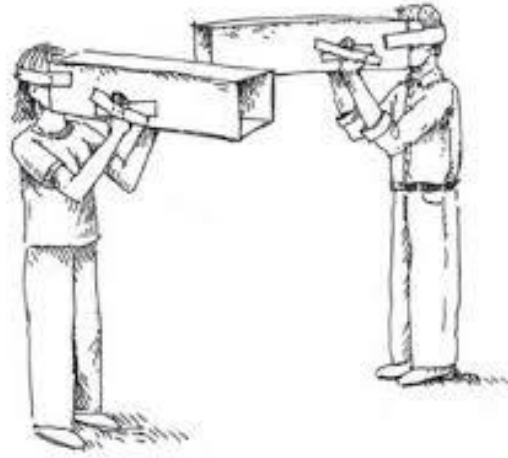

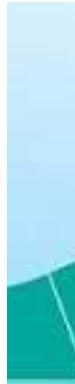

# Precision of vestibular diagnoses

- In the emergency setting the rate of incorrect diagnosis is about 80% (Kerber 2015).
- In general practice the percentage of incorrect or imprecise diagnoses is also high resulting in inappropriate investigations and treatments
- This often results in chronic symptoms, prolonged sick leaves or even permanent invalidity (Grill 2014, Neuhauser 2008).

# Problems of communication and diverging appreciations

# Building bridges to other expertise

Creation of a TF vertigo to take up the challenge
